What is Gitcoin?

A Mission to Grow Open Source.

A community at the intersection of blockchain and open source. A place for developers to collaborate in a new system, where open source money builds in monetization for open source repositories.

[Read More.](#)

Gitcoin is a decentralized application built on Ethereum's blockchain. However, Gitcoin does **not** have a native token.

Dan Finlay -- Metamask -- Internationalization

https://github.com/danfinlay

In Their Words:
Once we had merged in multiple language support from a bounty, it unblocked the path to all other translations, and what better way to get lots of different translations than with bounties from our

community? A single tweet of publicity and we had something like 20 language requests, and 10 language pull requests. It's been total magic.

Phil Elsasser: By design or not, there is an element of **trust** inherent within Gitcoin. This isn't the bad kind of "trust" that we are all trying to move away from in a centralized world, but a much better sense of community trust that gets established through the bounty process.
